

SOFTWARE ENGINEERING LAB

LAB 2: AGILE BACKLOG CREATION & SPRINT SIMULATION IN JIRA

NAME: Pooja L R

CLASS: CSE(AI&ML), H

SRN: PES1UG24AM475

PROBLEM STATEMENT :#55

Book Club Reading Challenge & Discussion Portal

Jira backlog with Epics, User Stories and Story points Assignment

Sprint board (Active Sprint view)

Sprint1:

To do:

In progress:

Done:

Sprint2:

To do:

In progress:

Done:

Burndown Chart

Sprint1:

Sprint2:

REFLECTION QUESTIONS

1) Did your estimations reflect the actual effort?

Answer:

Yes, the Story Point estimations provided a reasonable representation of the expected effort and complexity of the User Stories. Smaller stories such as setting a reading goal, revealing spoiler content, and voting for a book were assigned 3 Story Points, while more complex functionality such as tracking reading progress, creating discussion threads, posting spoiler-tagged comments, and creating monthly polls were assigned 5 Story Points.

Since the sprint was simulated, the Story Points were mainly used as relative estimates rather than measurements of actual development time. The estimation process helped compare the complexity of different User Stories and plan the amount of work that could be handled in each sprint.

2) Was your backlog well-prioritized?

Answer:

Yes, the backlog was prioritized according to the importance of the functionality to the users. Core features such as setting reading goals, tracking reading progress, participating in discussions, protecting spoiler content, creating polls, and voting were given high priority.

Features that were useful but less critical, such as viewing overall reading progress and viewing poll results, were given medium priority. This prioritization helped decide which User Stories should be completed first and which could be moved to the second sprint.

3) How did your simulated sprint align with your plan?

Answer:

The simulated sprints aligned with the planned Agile approach because the backlog was divided into two one-week sprints. Sprint 1 focused on the core reading challenge and chapter discussion functionality, while Sprint 2 focused on book selection and the remaining reading challenge functionality.

The User Stories were moved through the To Do, In Progress, and Done stages to simulate actual development progress. The division of the work allowed the larger backlog of 35 Story Points to be organized into smaller and manageable sprint commitments.

4) What insights did the Burndown Chart give about your team's capacity?

Answer:

The Burndown Charts provided an overview of the amount of work planned and the remaining Story Points during each sprint. Sprint 1 started with 21 Story Points and Sprint 2 started with 14 Story Points.

The charts showed how remaining work could be monitored against the expected guideline. This demonstrates that Burndown Charts can help a team understand its capacity, identify whether work is progressing as expected, and recognize situations where too much or too little work has been committed.

The simulation also demonstrated that accurate Story Point estimation and appropriate sprint planning are important for maintaining a realistic workload.
